

Eriacta

(sildenafil citrate) tablets

How Does Eriacta Work?

The problem of erectile dysfunction has become one of the most common problems in the men these days. There are a number of reasons because of which people fall prey to this illness. This problem, more commonly known as impotency has a number of ill effects on the life of a person. Firstly, he fails to get indulged in any kind of sexual activity with his partner. Secondly, he starts losing his self-confidence and lastly his life becomes meaningless as there is no excitement left. Eriacta is considered to be one of the most effective treatments for the longing problem of erectile dysfunction, or as we call it, impotency. This treatment has been used by a majority of people today and the results of the same are positive.

Let us understand the manner in which Eriacta works on the human's body.

Eriacta works for all the men who have been suffering from the problem of erectile dysfunction from a long period of time. This drug comprises of an active ingredient known as sildenafil that is considered to be the essence of the treatment of erectile dysfunction. Eriacta in men works by the way of increasing the flow of blood into the penis of person so that he would be able to get an erection and to further keep it hard enough which is required for sex. Another important thing, Eriacta works only when you stimulate yourself sexually. Thus, if you are not completely sexually stimulated, Eriacta doesn't work at all. Thus, you must consume this drug four hours before you indulge in any kind of sexual activity with your partner. Once you have consumed Eriacta in a concerned dose, it starts working within a period of 30 to 60 minutes.

The sildenafil present in Eriacta tends to block the PDE5 in order to allow the blood to stay in your penis for a longer period of time since the muscles present in the penis do not constrict. Eriacta helps it by the way of blocking the chemical which causes the blood to leave the penis. Thus, there is more blood present in the penis that further helps a man to maintain his erection for a longer period of time. As already stated, you need to involve yourself into any kind of sexual stimulation in order to maintain an erection after the consumption of Eriacta as this drug doesn't have any kind of effect on the chemicals which develop an erection in a man. Thus, Eriacta plays the role of keeping all these chemicals in the penis for a longer period of time.

Eriacta comes in a number of forms starting from a minimum dose of 25mg and reaching to 50mg and 100mg in the form of pills. If you are taking Eriacta for the first time, you shall start off with a dose of 50mg in a tablet. The effect of this pill will depend upon the body of an individual. This dose could be further decreased to 25mg if the results of the early dose of tablets are positive and effective. If the same is ineffective, don't hesitate to start with a 100mg dose.
